

Which star citizen community web sites offer APIs to items, ship specs, etc

I'll check the current state rather than trust memory here, because Star Citizen tooling changes a lot and some "APIs" are undocumented or semi-private.

Thought for 38s >

Here are the ones that actually matter for **items / ships / components / prices / locations**:

Site / Project	API status	Best for	Notes
Star Citizen Wiki API / star-citizen.tools	Yes, public REST API	Ships, vehicles, components, FPS items, commodities, locations, missions, starmap, comm-links, Galactapedia	Probably the best general-purpose API. versioned data and has Swagger docs. their repo: <code>GET https://api.star-citizen.wiki/api/vehicles?filter[nam</code> GitHub
UEX Corp	Yes, public API 2.0 with Bearer token	Commodity prices, item prices, vehicle prices, terminals, trade routes, mining/refining, marketplace	Best for economy/trade/pricing. Require app/token. API docs list resources like <code>items_prices</code> , <code>vehicles</code> , <code>vehicles_p</code> , <code>commodities_prices</code> , <code>terminals</code> , etc.
StarCitizen-API.com	Yes, public-ish API with API key	RSI website data, users/orgs, ships, roadmap, stats, telemetry, starmap, gamedata	Older but still documented. It has section data and GameData, and requires an API key StarCitizen API
Erkul.games	No official public API found	Ship loadouts, DPS, weapons/components, power/cooling simulation	The site clearly has data behind it, but I didn't find a documented public API. Treat scraping/using as fragile. Erkul is still one of the best UIs for ship/component stats. Star Citiz...
SPViewer	No obvious public API found	Ship performance, fuel, capacitors, component stats, flight performance	Great visual/performance reference, but I didn't find a public API docs. SP Viewer
SC Trade Tools	No clear public API found	Trade routes, item finder, commodity/shop info	The site is useful, but I found UEX's API. UEX also says it is partnered with SC Trade Tools.
SCMDb	No public API docs found	Crafting, blueprints, missions, resources	I found references saying SCMDb extracts data from the game, but I didn't find official API documentation. So: assume it's unofficial unless the dev exposes something private.
FleetYards	Maybe/unclear for API	Ship specs, fleet/hangar style references, ship pages	Useful site; API availability wasn't obvious from search results.

Site / Project	API status	Best for	Notes
Raw data: scunpacked-data / ScDataDumper ecosystem	Yes, via GitHub/raw data, not “API”	Dataminid JSON for items, vehicles, manufacturers, labels, tags	Star Citizen Wiki API says its primary ga source is <code>scunpacked-data</code> , which is un game data. Good if you want to self-hos your own DB. GitHub

Best answer for your use case:

Use **Star Citizen Wiki API** for canonical-ish item/ship/component/spec data, and **UEX API** for prices, terminals, trade, mining, and economy data.

For example:

</> Bash

```
curl 'https://api.star-citizen.wiki/api/vehicles?filter[name]=Arrow'
```

UEX pattern:

</> Bash

```
curl -H "Authorization: Bearer YOUR_TOKEN" \  
  'https://api.uexcorp.uk/2.0/items/'
```

Practical call:

If you’re building something like a local Star Citizen item/component index, I’d wire it like this:

1. **Star Citizen Wiki API**: vehicles, components, items, missions, locations.
2. **UEX API**: live/community prices, terminals, trade routes.
3. Optional local cache from **scunpacked-data** if you want durability and don’t want to depend on API uptime.
4. Avoid depending on Erkul/SPViewer private endpoints unless you’re cool with random breakage.
